BUILDINGDATABASE
Platform for building materials & buildings

Functions and benefits of the platform:

For craft businesses, planners, architects and component / building material manufacturers

- **Information of installed products** incl. location and year of installation are visible*
- **Reporting of all maintenance** of the products*
- **Data security** by certified providers (according to ISO 2700) & data management on German servers
- **Tamper-proof data** and storage

For builders and building owners**

- **Creation** of a digital **building file**
- **Increase of transparency** by centrally bundling the information of building materials, components and buildings
- **Use of stored house types and datasheets** of the manufacturers (no separate inquiry with individual manufacturers required)
- **Automatic reminder function** for upcoming maintenance and replacement cycles***
- **Data security** by certified providers (according to ISO 2700) & data management on German servers
- **Tamper-proof data** and storage

* Information is visible when users allow it | ** For free as basic version | *** For premium users

THE PROBLEM
Much information about building materials, components and buildings is available. This information is poorly bundled but requested by customers in different ways & with different people / instances. There is no single source.

THE SOLUTION
The BuildingDatabase should bundle all this information tamper-proof and make it available to various stakeholders for years. For this purpose, products used in the respective building should be assignable over the entire life cycle. Information regarding labeling, quantities used, critical materials, risks etc. is given. Maintenance and care instructions can also be stored.
